George Em Karniadakis' Group, Division of Applied Mathematics, Brown University

9/2014–5/2020

- **Deep learning**
 - **Theory:** Proved that deep neural networks will converge to erroneous mean states of the target function with high probability. Quantified the generalization error of neural networks for classification problems in terms of data distribution and neural network smoothness.
 - **Algorithms & applications:** Developed physics-informed neural networks to solve forward and inverse partial differential equations (PDEs), fractional PDEs, and stochastic PDEs. Developed multi-fidelity networks to predict mechanical properties of solid materials. Developed deep operator networks to learn operators from a relatively small dataset with exponential convergence.
 - **Software:** Developed DeepXDE¹, a deep learning library for solving differential equations. (>40,000 downloads on PyPI and Anaconda, >200 GitHub Stars, >70 Forks)
- **Computational biophysics**
 - **Molecular biomechanics:** Developed a multiscale coarse-grained particle model of sickle hemoglobin (HbS) to probe the polymerization process, mechanical and structural properties of HbS fibers in sickle cell disease (SCD). Developed coarse-grained models to simulate the self-assembly of amyloids.
 - **Cellular biomechanics:** Simulated the dynamics of red blood cells (RBCs) traversing the interendothelial slit in the human spleen, which reveals that the spleen senses and clears RBCs with abnormal shapes and deformability.
 - **Kinetics:** Developed a kinetic model of erythrocyte sickling to examine the effectiveness of potential anti-sickling drug candidates.
 - **Software:** Developed OpenRBC², a fast simulator of red blood cells at protein resolution. (Third Prize, IBM OpenPOWER Developer Challenge contest, 2016)
